

## Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact [support@jstor.org](mailto:support@jstor.org).

6. Or we may assume  $\psi = (\cos x)^{2m}$ ; whence

$$\left(\frac{\psi'}{\psi}\right) = -2m \sec^2 x, \quad r = \frac{1}{m}, \quad k = -2m, \quad \text{and } \theta - \phi = c_1 + c \tan x.$$

In this case the general formula (3) becomes

$$[(D+\phi)(D+\phi+c_1+c \tan x)-(n+1)(c+n) \sec^2 x]y = X.$$

By putting  $\phi = c_2$ , and  $c = 0$ , this is reduced to

$$\{(D+c_1)(D+c_2)-n(n+1) \sec^2 x\} y = X,$$

which is the equation solved by Dr. Hargreave at p. 52, in the Paper already referred to, and from a particular case of which he derives the solution of the equation of Laplace's functions.

Sir Robert Kane read a paper by the Rev. Professor Callan, on the results of a series of experiments on the decomposition of water by the iron galvanic battery, with the view of obtaining a brilliant lime light.
